1 Introduction

Welcome to ffr-LFDFT documentation.

ffr-LFDFT is a poor man's program (or collection of subroutines, as of now) to carry out electronic structure calculations based on density functional theory and Lagrange basis set.

How to compile

How to use

input parameters ...

subroutines ... (implementation)

Add tutorial on how to use m.LF3d module to solve Schrodinger equation in 1d.

In LF3d periodic, only gamma-point sampling is used.

2 Installation

A manually written Makefile is provided. At the topmost part of the Makefile you need to specify which make.inc file you want to use. You need to decide which compiler to use if there are more than one compiler in you system. In the directory platform there are several make.inc files. Currently, ffr-LFDFT is tested using the following compilers on Linux system:

- GNU Fortran compiler
- G95 Fortran compiler
- Intel Fortran compiler
- PGI Fortran compiler

• Sun (now part of Oracle) Fortran compiler

For typical Linux system, make.inc.gfortran is sufficient. You can manually edit the compiler options in the corresponding make.inc files.

There following external libraries are required to build ffr-LFDFT

- BLAS
- LAPACK
- FFTW3

Typing the command

make

will build the library libmain.a and typing the command

make main

will build the main executable ffr_LFDFT.x.

3 Usage

```
ffr-LFDFT main executable, ffr_LFDFT.x supports a subset of PWSCF input file.
```

```
&CONTROL
/

&SYSTEM
/

&ELECTRONS
/

ATOMIC_SPECIES
...

ATOMIC_POSITIONS angstrom
```

4 Kohn-Sham equation

In this section a brief introduction to Kohn-Sham equation is given. Kohn-Sham equation can be written as:

$$\left[-\frac{1}{2} \nabla^2 + V_{KS}(\mathbf{r}) \right] \psi_i(\mathbf{r}) = \epsilon_i \psi_i(\mathbf{r}) \tag{1}$$

with the so-called Kohn-Sham potential

$$V_{\rm KS}(\mathbf{r}) = V_{\rm ext}(\mathbf{r}) + V_{\rm Ha}(\mathbf{r}) + V_{\rm xc}(\mathbf{r}) \tag{2}$$

5 Implementation

ffr-LFDFT is implemented in simple Fortran language. I used global variables heavily, as opposed to using user-defined type to contained them. Currently, only one user-defined type is used in ffr-LFDFT, namely Ps_HGH_Params_T which is mainly used for convenience. I tried to make the code clear for those who are beginners in implementing a density-functional calculations (such as myself).

The general flow of the main program is as follows:

- Getting program argument as input file and reading the input file
- Initializing molecular structure, pseudopotentials, and Lagrange basis functions, including grids
- Setting additional options if necessary based on the input file
- Initializing electronic states variables
- Setting up Hamiltonian: potential and kinetic operators.
- Solving the Kohn-Sham equation via direct minimization or self-consistent field

5.1 Description of LF basis set

Description of LF basis set in 3d is given in module m_LF3d. All global variables in this module is given prefix LF3d.

```
MODULE m_LF3d
  IMPLICIT NONE
  INTEGER, PARAMETER :: LF3d_PERIODIC = 1
  INTEGER, PARAMETER :: LF3d_CLUSTER
  INTEGER, PARAMETER :: LF3d_SINC
  INTEGER :: LF3d_TYPE
  INTEGER, DIMENSION(3) :: LF3d_NN
  REAL(8), DIMENSION(3) :: LF3d_LL
  REAL(8), DIMENSION(3) :: LF3d_AA, LF3d_BB
  REAL(8), DIMENSION(3) :: LF3d_hh
  INTEGER :: LF3d_Npoints
  REAL(8) :: LF3d_dVol
  REAL(8), ALLOCATABLE :: LF3d_grid_x(:)
  REAL(8), ALLOCATABLE :: LF3d_grid_y(:)
  REAL(8), ALLOCATABLE :: LF3d_grid_z(:)
  REAL(8), ALLOCATABLE :: LF3d_D1jl_x(:,:)
  REAL(8), ALLOCATABLE :: LF3d_D1jl_y(:,:)
  REAL(8), ALLOCATABLE :: LF3d_D1jl_z(:,:)
  REAL(8), ALLOCATABLE :: LF3d_D2j1_x(:,:)
  REAL(8), ALLOCATABLE :: LF3d_D2j1_y(:,:)
  REAL(8), ALLOCATABLE :: LF3d_D2j1_z(:,:)
  REAL(8), ALLOCATABLE :: LF3d_lingrid(:,:)
  INTEGER, ALLOCATABLE :: LF3d_xyz2lin(:,:,:)
  INTEGER, ALLOCATABLE :: LF3d_lin2xyz(:,:)
  REAL(8), ALLOCATABLE :: LF3d_G2(:)
  REAL(8), ALLOCATABLE :: LF3d_Gv(:,:)
END MODULE
```

Variables in m_LF3d is initialized by calling the subroutine init_LF3d_XX(), where XX may be one of:

- p: periodic LFF
- c: cluster LF
- sinc: sinc L

```
SUBROUTINE init_LF3d_p( NN, AA, BB )
SUBROUTINE init_LF3d_c( NN, AA, BB )
SUBROUTINE init_LF3d_sinc( NN, hh )
```

In the above subroutines:

- NN: an array of 3 integers, specifying sampling points in x, y and z direction.
- AA: an array of 3 floats, specifying left ends of unit cell.
- BB: an array of 3 floats, specifying right ends of unit cell.
- hh: an array of 3 floats, specifying spacing between adjacent sampling points.

Note that for periodic and cluster LF we have to specify NN, AA, and BB while for sinc LF we have to specify NN and hh. Note that for periodic LF NN must be odd numbers. Example:

```
NN = (/ 35, 35, 35 /)
AA = (/ 0.d0, 0.d0, 0.d0 /)
BB = (/ 6.d0, 6.d0, 6.d0 /)
CALL init_LF3d_p( NN, AA, BB )
```

5.2 Description of molecular or crystalline structure

Description of molecular or crystalline structure is given in module m_atoms. Note that, unit cell for crystalline structure (currently only orthorombic structure is possible) is specified by AA and BB in call to init_LF3d_p()

```
MODULE m_atoms

IMPLICIT NONE

INTEGER :: Natoms

INTEGER :: Nspecies

REAL(8), ALLOCATABLE :: AtomicCoords(:,:)

INTEGER, ALLOCATABLE :: atm2species(:)

CHARACTER(5), ALLOCATABLE :: SpeciesSymbols(:)

REAL(8), ALLOCATABLE :: AtomicValences(:)

COMPLEX(8), ALLOCATABLE :: StructureFactor(:,:)

END MODULE
```

Currently, variables in module m_atoms are initialized by subroutine init_atoms_xyz().

```
SUBROUTINE init_atoms_xyz( fil_xyz )
```

This subroutine takes one argument fil_xyz which is the path to XYZ file describing the molecular structure or crystalline structure.

5.3 Pseudopotential

Module m_PsPot

```
MODULE m_PsPot

USE m_Ps_HGH, ONLY : Ps_HGH_Params_T

IMPLICIT NONE

CHARACTER(128) :: PsPot_Dir = './HGH/'

CHARACTER(128), ALLOCATABLE :: PsPot_FilePath(:)

TYPE(Ps_HGH_Params_T), ALLOCATABLE :: Ps_HGH_Params(:)

INTEGER :: NbetaNL

REAL(8), ALLOCATABLE :: betaNL(:,:)

INTEGER, ALLOCATABLE :: prj2beta(:,:,:,:)

INTEGER :: NprojTotMax

END MODULE
```

We currently support HGH pseudopotential only. The HGH pseudopotential parameter is described by an array of type Ps_HGH_Params_T which is defined in m_Ps_HGH:

```
TYPE Ps_HGH_Params_T

CHARACTER(5) :: atom_name

INTEGER :: zval

REAL(8) :: rlocal

REAL(8) :: rc(0:3)

REAL(8) :: c(1:4)

REAL(8) :: h(0:3, 1:3, 1:3)

REAL(8) :: k(0:3, 1:3, 1:3)

INTEGER :: lmax

INTEGER :: Nproj_l(0:3) ! number of projectors for each AM

REAL(8) :: rcut_NL(0:3)

END TYPE
```

5.4 Nonlocal pseudopotential

Nonlocal HGH pseudopotential action can be defined as follows:

$$\hat{V}_{\rm NL}\psi = \tag{3}$$

A Lagrange basis function

A.1 Periodic Lagrange function

For a given interval [0, L], with L > 0, the grid points x_i appropriate for periodic Lagrange function are given by:

$$x_i = \frac{L}{2} \frac{2i - 1}{N} \tag{4}$$

with i = 1, ..., N. Number of points N should be an odd number.

The periodic cardinal functions $L_i^{\text{per}}(x)$, defined at grid point i are given by:

$$L_i^{\text{per}}(x) = \frac{1}{\sqrt{NL}} \sum_{n=1}^{N} \cos\left(\frac{\pi}{L} (2n - N - 1)(x - x_i)\right).$$
 (5)

The expansion of periodic function in terms of Lagrange functions:

$$f(x) = \sum_{i=1}^{N} c_i L_i^{\text{per}}(x)$$
(6)

with expansion coefficients $c_i = \sqrt{L/N} f(x_i)$. When doing variational calculation, the coefficients c_i are the variational parameters. The actual function values $f(x_i)$ at grid points x_i is obtained by $f(x_i) = \sqrt{N/L} c_i$. The prefactor is sometimes abbreviated by h = L/N and is also referred to as scaling factor.

Consider periodic potential in one dimension:

$$V(x+L) = V(x). (7)$$

Floquet-Bloch theorem states that the wave function solution for periodic potentials can be written in the form:

$$\psi_k(x) = e^{ikx}\phi_k(x) \tag{8}$$

where function $\phi_k(x)$ and its first derivative $\phi'_k(x)$ have the same periodicity as V(x) and k is a constant called the crystal momentum. Substituting this expression to Schrödinger equation we obtain:

$$\left[-\frac{\hbar^2}{2m} \left(\frac{\mathrm{d}^2}{\mathrm{d}x^2} + 2ik \frac{\mathrm{d}}{\mathrm{d}x} - k^2 \right) + V(x) \right] \phi_k(x) = E\phi_k(k). \tag{9}$$

An alternative way of enforcing periodicity of the wave function is to require that:

$$\psi_k(x+L) = e^{ikL}\psi_k(x). \tag{10}$$

This condition follows from:

$$\psi_k(x+L) = e^{ik(x+L)}\phi_k(x+L)$$

$$= e^{ik(x+L)}\phi_k(x)$$

$$= e^{ikL}e^{ikx}\phi_k(x)$$

$$= e^{ikL}\psi_k(x)$$

Using periodic cardinal the Schrodinger equation for periodic potential can be written as:

$$\sum_{i=1}^{N} \left[-\frac{\hbar^2}{2m} \left(D_{jl}^{(2)} + 2\imath k D_{jl}^{(1)} - k^2 \delta_{jl} \right) + V(j) \delta_{jl} \right] \phi(j) = E\phi(l)$$
(11)

with l = 1, ..., N. $D_{jl}^{(1)}$ are matrix elements of the first derivatives:

$$D_{jl}^{(1)} = \begin{cases} 0 & j = l \\ -\frac{2\pi}{L} (-1)^{j-l} \left(2\sin\frac{\pi(j-l)}{N} \right)^{-1} & j \neq l \end{cases}$$
 (12)

and $D_{il}^{(2)}$ are matrix elements of the second derivatives, N' = (N-1)/2:

$$D_{jl}^{(2)} = \begin{cases} -\left(\frac{2\pi}{L}\right)^2 \frac{N'(N'+1)}{3} & j=l\\ -\left(\frac{2\pi}{L}\right)^2 (-1)^{j-l} \frac{\cos(\pi(j-l)/N)}{2\sin^2[\pi(j-l)/N]} & j \neq l \end{cases}$$
(13)

Note that, $D_{jl}^{(1)}$ is not symmetric, but $D_{jl}^{(1)} = -D_{lj}^{(1)}$. Meanwhile, the second derivative matrix $D_{jl}^{(2)}$ is symetric, i.e. $D_{jl}^{(2)} = D_{lj}^{(2)}$. With the above expressions, first and second derivative of periodic cardinals can be expressed as

$$\frac{\mathrm{d}}{\mathrm{d}x}L_i^{\mathrm{per}}(x) = \sum_{j=1}^{N} D_{ji}^{(1)} L_j^{\mathrm{per}}(x)$$
(14)

$$\frac{\mathrm{d}^2}{\mathrm{d}x^2} L_i^{\text{per}}(x) = \sum_{j=1}^N D_{ji}^{(2)} L_j^{\text{per}}(x)$$
(15)

The previous approach also can be extended to periodic potential in 3D:

$$V(\mathbf{r}) = V(x, y, z) = V(x + L_x, y + L_y, z + L_z)$$

Using periodic LF, Schrodinger equation can be casted into the following form:

$$\left[-\frac{\hbar^2}{2m} \left(\nabla^2 + 2i \mathbf{k} \cdot \nabla - \mathbf{k}^2 \right) + V(\mathbf{r}) \right] \phi_{\mathbf{k}}(\mathbf{r}) = E \ \phi_{\mathbf{k}}(\mathbf{r})$$
(16)

A.2 Cluster Lagrange function

For a given interval [A, B], with B > A, the grid points x_i appropriate for cluster Lagrange function are given by:

$$x_i = A + \frac{B - A}{N + 1}i$$

where i = 1, ..., N. Number of points N can be either odd or even number. The cluster Lagrange functions $L_i^{\text{clu}}(x)$, defined at grid point i are given by:

$$L_i^{\text{clu}}(x) = \frac{2}{\sqrt{(N+1)(B-A)}} \sum_{n=1}^N \sin(k_n(x_i - A)) \sin(k_n(x - A)).$$
 (17)

where $k_n = \pi n/(B-A)$. The expansion of a function f(x) in terms of cluster Lagrange functions:

$$f(x) = \sum_{i=1}^{N} c_i L_i^{\text{clu}}(x)$$
(18)

with expansion coefficients $c_i = \sqrt{(B-A)/(N+1)}f(x_i)$. When doing variational calculation, the coefficients c_i are the variational parameters. The actual function values $f(x_i)$ at grid points x_i is obtained by $f(x_i) = \sqrt{(N+1)/(B-A)}c_i$.

Matrix elements $D_{jl}^{(2)}$ of the second derivatives for cluster Lagrange functions are

$$D_{jl}^{(2)} = \begin{cases} -\frac{1}{2} \left(\frac{\pi}{B-A}\right)^2 \frac{2(N+1)^2 + 1}{3} - \frac{1}{\sin^2\left[\pi j/(N+1)\right]} & j = l\\ -\frac{1}{2} \left(\frac{\pi}{B-A}\right)^2 (-1)^{j-l} \left[\frac{1}{\sin^2\left[\frac{\pi(j-l)}{2(N+1)}\right]} - \frac{1}{\sin^2\left[\frac{\pi(j+l)}{2(N+1)}\right]}\right] & j \neq l \end{cases}$$

$$(19)$$

For free or cluster boundary condition, we don't need $D_{jl}^{(1)}$.
